Abstract. Anomalous refraction in gases was discovered by Jahn (1956) during experiments with shocks refracting at an Air/CO₂ gas interface. Jahn's experiments were confined to the case when the wave impedance decreases during the refraction, $|Z_t| < |Z_i|$, in which case the incident shock is overrun by upstream-moving expansions that locally weaken it and cause it to curve backward. We show that Jahn's model for this phenomenon (classical anomalous refraction) must be modified in one important respect, namely that there is still a centered supersonic expansion at the node R . We also show that anomalous refraction can occur when the impedance increases, $|Z_t| > |Z_i|$, in which case the incident shock is overrun by upstream moving compressions that locally strengthen it and cause it to move forward.

Key words: Anomalous shock refraction, Wave impedance

1. The refraction law

Suppose that a shock wave i is propagating with a velocity U_i in a material whose properties and state are known, and suppose also that it enters another material with different properties, or state, that are also known, and that causes its velocity to change to U_t . The shock will be said to refract whenever U_i differs in either magnitude or direction from U_t . For simplicity it will be assumed the boundary m between the two materials is a plane surface, and that i encounters it at some angle of incidence α_i (Fig.1). If the incident and transmitted shocks meet at a single point on the interface, and travel at the same speed along it, then the angle of transmission α_t is related to α_i by the refraction law,

$$\frac{U_i}{\sin \alpha_i} = \frac{U_t}{\sin \alpha_t} \quad (1)$$

where $U_{i,t} = |U_{i,t}|$ are the wave speeds measured in the laboratory frame (Fig.1). The relative refractive index η is defined as,

$$\eta \equiv \frac{U_i}{U_t} = \frac{\sin \alpha_t}{\sin \alpha_i} \quad (2)$$

from which it is concluded that the shock will be refracted by the materials whenever $\eta \neq 1$.

2. Wave impedance

The wave impedance for an arbitrary one-dimensional shock i is defined as

$$Z_i \equiv \frac{P_1 - P_0}{U_{pi}} \quad (3)$$

where P is the pressure, the subscripts 0, 1 refer to the conditions upstream and downstream of the shock, and U_{pi} is the (signed) speed of the piston associated with the i shock (see Henderson 1989 or Henderson et al. 1991). In other words, $U_{pi} \equiv \mathbf{u}_1 - \mathbf{u}_0$, where $\mathbf{u}_{0,1}$ is the velocity of the material upstream (*resp.* downstream) of the shock. If Z_i is interpreted as the mass flux, then Eq.3 is simply the momentum equation for the flow perpendicular to i .

The impedance Z_e of a one-dimensional expansion wave e may also be defined as in Eq.3. Thus,

$$Z_e \equiv \frac{P_2 - P_1}{U_{pe}} \quad (4)$$

where $P_{2,1}$ are the pressure upstream and downstream of the wave, U_{pe} is the magnitude of the piston velocity $\mathbf{U}_{pe} \equiv \mathbf{u}_2 - \mathbf{u}_1$ associated with the expansion, and $\mathbf{u}_{1,2}$ are the velocity of the medium upstream and downstream of the wave. Note that \mathbf{U}_{pe} is the velocity of a piston which is *withdrawing* in the direction opposite that of the wave propagation.

When $\alpha_i = 0$, there will in general be a reflected wave propagated back into the initial material as i passes into the receiving material. The reflection may either be a compression r , or an expansion e . More precisely it will be a compression if the magnitude of the wave impedance increases $|\mathcal{Z}_t| > |\mathcal{Z}_i|$ and an expansion if it decreases $|\mathcal{Z}_t| < |\mathcal{Z}_i|$, but there will be no reflection if there is no change in the impedance $\mathcal{Z}_t = \mathcal{Z}_i$. In this last case the wave system consists only of two shocks and we call it a *shock pair* (Henderson and Puckett 1993).

For an oblique shock, that is one for which $\alpha_i \neq 0$, the theory is simplified if we define an *effective impedance* Z_i by

$$Z_i \equiv \frac{P_1 - P_0}{U_{pi} \cos \beta_i}, \quad (5)$$

where β_i is the angle that i makes with the *disturbed* (downstream) interface labelled d in Fig.1. For the r and t waves Z_r and Z_t are defined in a manner analogous to Eq.5 with $\beta_{r,t}$ and $\mathbf{U}_{pr,t}$ defined as shown in Fig.1. The effective impedance is the natural generalization of the *effective acoustic impedance* (Kinsler et al. 1982) to shock waves.

The definition of the effective impedance Z_e for a centered expansion wave in two dimensions is a bit more difficult, since an expansion of the Prandtl-Meyer type is not a single plane surface, but a fan of such surfaces. We have,

$$Z_e \equiv \frac{P_2 - P_1}{\int d(U_{pj} \cos \beta_j)} = \frac{P_2 - P_1}{(\mathbf{u}_2 - \mathbf{u}_1) \cdot \mathbf{n}}, \quad (6)$$

where U_{pj} denotes the magnitude of the piston velocity \mathbf{U}_{pj} associated with the “ j th” wave in the expansion fan, β_j denotes the angle this wave makes with the disturbed gas and \mathbf{n} is a unit vector normal to the disturbed gas interface.

3. The classical model of anomalous refraction

Anomalous refraction in gases was discovered by Jahn (1956) during his experiments with the Air/CO₂ combination of materials. When α_i was sufficiently small the refraction was regular, and its reflected wave was a centered (Prandtl-Meyer) expansion (Fig.3a), this is a regular-refraction-with-a-reflected-expansion and is denoted by RRE. With α_i increasing continuously, a critical condition was attained where the flow Mach number M_1 downstream of, and relative to i , became sonic: $M_1 = 1$. The critical angle of incidence α_i^* is:

$$\tan^2 \alpha_i^* = \frac{U_i^2}{a_1^2 - (U_i - U_{pi})^2} = \frac{q_{n0}^2}{a_1^2 - q_{n1}^2}. \quad (7)$$

Here U_i and U_{pi} are measured in laboratory coordinates as shown in Fig.1, while q_{n0} and q_{n1} are the normal components of the particle velocity upstream and downstream of the incident shock i , measured in coordinates at rest with respect to the shock. It will be noticed that Eq.7 is valid for any material and that it does not depend on the properties of the receiving material, nor on any wave or boundary parameter of the transmitted shock t .

Jahn observed that when $\alpha_i > \alpha_i^*$ the expansion waves were able to overrun part of i and to cause some attenuation of it, and consequently that part i' was swept in the downstream direction, and curved backward. At the same time the reflected wave spreads out into a distributed band of expansions (Fig.2 and Fig.3e). The result was an anomalous-refraction-with-reflected-expansions (ARE). (The upper case “E”, indicates sonic or supersonic flow downstream of i .) The Jahn

Fig. 1. Regular refraction

Fig. 2. Classical anomalous refraction

model assumes that the disturbed part of the shock i' has a sonic surface everywhere at its rear. Consequently Eq.7 is satisfied at every point on i' . This is only possible if i' weakens monotonically, and also the speed of sound a_1 decreases monotonically, as i' approaches the refraction node R.

4. A general theory of anomalous refraction

Let $\xi_i \equiv P_0/P_1$ denote the (inverse) incident shock strength. For a given ξ_i let α_p denote the angle at which equality of the (effective) impedance $Z_t = Z_i$ occurs. Now define ξ_{ip}^* to be the shock strength for which the condition $Z_t = Z_i$ coincides with the onset of anomalous refraction $\alpha_i = \alpha_i^*$. In other words, when $\xi_i = \xi_{ip}^*$ we have $\alpha_i = \alpha_i^* = \alpha_p$. By examining the i and t shock polars one can show that for the Air/CO₂ gas combination $\alpha_p < \alpha_i^* \iff \xi_i > \xi_{ip}^*$, and also that $\alpha_i < \alpha_p \iff |Z_i| > |Z_t|$ (Puckett et al. 1993). We call $\xi_i > \xi_{ip}^*$ *weak* refractions and $\xi_i < \xi_{ip}^*$ *strong* refractions. By chance rather than design Jahn only studied weak refractions, and hence (the magnitude of) the wave impedance was always decreasing $|Z_t| < |Z_i|$ in the anomalous regime $\alpha_i > \alpha_i^*$. In the following we examine numerically one of his experimental sequences, and then also examine a strong refraction sequence in Air/CO₂.

4.1 Air/CO₂ with $\xi_i = 0.85$ (weak refractions)

A sequence with $\xi_i = 0.85$ held constant was studied experimentally by Jahn (1956). It is a weak refraction sequence since $\xi_i = 0.85 > \xi_{ip}^* = 0.29064$. By the theory developed in Puckett et al. (1993) the only possible refractions are RRE and ARE. Some numerical results for this sequence are presented in Fig.3. We plot contours of $\log P$ in Figs.3a,c,e,g and contours of the Mach number \tilde{M} in *self-similar* coordinates in Figs.3b,d,f,h. In these latter figures solid lines indicate the sonic and supersonic contours $\tilde{M} \geq 1$. The sonic contour $\tilde{M} = 1$ is the last solid contour.

Figs.3a-b are for $\alpha_i = 69^\circ < \alpha_i^* = 71.116^\circ$ which is an RRE. Transition to the anomalous system, RRE \rightleftharpoons ARE, takes place at $\alpha_i = \alpha_i^* = 71.116^\circ$; the results are presented in Figs.3c-d. For $\alpha_i = 75.0^\circ > \alpha_i^*$, there is an ARE (Figs.3e-f). The centered expansion wave has now partly spread out and over-run a portion of the incident shock i and thus produces the partly attenuated shock i' . In Fig.3f, the sonic contour coincides with the rear of i' , which is as it should do if the Jahn model of ARE (Fig.2) is correct. However the results do differ from his model in one important respect, namely that *there is still a centered supersonic expansion at the node*. This has also been mentioned by Grove and Menikoff (1990).

Fig. 3a. RRE at $\alpha_i = 69^\circ$ ($\log P$)

Fig. 4h. ARe at $\alpha_i = 85^\circ$ (\tilde{M})

Fig. 4. Shock refraction sequence in Air/CO₂ with $\xi_i = 0.1$

With further development to $\alpha_i = 85^\circ$ (Figs.3i-j) the centered fan has all but vanished, although the sonic condition remains everywhere at the rear of i' (Fig.3j). This last computation corresponds to the experiment shown in Fig.14h, Plate 11 of Jahn (1956). According to our results his interpretation of the structure of the refraction is essentially correct because the remains of the centered expansion wave has all but vanished in this case. It is concluded that the structure of an ARE is as described by Jahn, except for the addition of a centered (Prandtl-Meyer) expansion wave which emanates from the refraction node.

4.2 Air/CO₂ with $\xi_i = 0.10$ (strong refractions and variable impedances)

When the refraction is weak $\xi_i > \xi_{ip}^*$, the equality of impedance condition $Z_i = Z_t$ occurs in the regular range $\alpha_p < \alpha_i^*$ for Air/CO₂. Therefore in the anomalous range $\alpha_i > \alpha_i^* > \alpha_p$, and the only possible system is one with sonic expansions at the rear of i' , that is an ARE. This was well supported by the numerical results presented in §4.1. The same conclusions apply to the other sequence ($\xi_i = 0.3$) studied experimentally by Jahn, since here also $\xi_i = 0.3 > \xi_{ip}^* = 0.29064$. If a reflected compression is to occur for the Air/CO₂ combination, then the $Z_i = Z_t$ condition should lie in the anomalous range; that is, it must be a strong shock refraction, $\alpha_p > \alpha_i^*$.

In order to make numerical tests of this conclusion, an Air/CO₂ sequence was chosen with $\xi_i = 0.1 < \xi_{ip}^* = 0.29064$, with three values of α_i . One value was $\alpha_i = 67.2428^\circ$ which is midway between $\alpha_i^* = 64.272^\circ$ and $\alpha_p = 70.2135^\circ$, so $|Z_i| < |Z_t|$. According to the theory this should be an anomalous-refraction-with-reflected-compressions (ARc), and indeed it is, as one can see in Figs.4a-d. (The lower case "c" indicates subsonic flow downstream of i .) Fig.4b is an enlargement of Fig.4a about the node R, and it will be noticed that i' now moves forward of i as it is overtaken by subsonic compressions arising downstream. The fact that the flow downstream of i' is subsonic is demonstrated in Figs.4c-d. The second value was $\alpha_i = \alpha_p = 70.2135^\circ$ where $Z_i = Z_{i'} = Z_t$, and it is shown in Figs.4e-f. Notice that i and i' are now indistinguishable and that $i = i'$ and t are all planar. Consequently the flows are all uniform about the node and are subsonic downstream of $i = i'$ and supersonic downstream of t (Fig.4f). We call it a *regular shock pair* (RSP). The third value was $\alpha_i = 85^\circ > \alpha_p$, where $|Z_i| > |Z_t|$, and as expected i' now leans backward of i (Fig.4g-h), and the flow downstream of i' is subsonic, in other words it is an ARE. These results are also consistent with the predictions of the theory. The theory is also supported by experiment (Abd-el-Fattah and Henderson 1978) and numerical work (Puckett et al. 1993) with the Air/SF₆ gas combination.

Survey Paper

Volume I: Hypersonics, Shock Tube and Shock Tunnel Flow - An Introductory Survey John L. Stollery	3
--	---

Plenary Lectures

A Life with Shock Waves (Ernst Mach Memorial Lecture) Lucien Z. Dumitrescu	7
Computational Analysis on Generic Forms in European Hypersonic Facilities: Standard Model Electre and Hyperboloid-Flare J. Muylaert, L.M.G. Walpot and G. Durand	19
Shock Tube Investigations of Combustion Phenomena in Supersonic Flows G. Smeets	29

Part 1: Hypersonic Flow and Aerospace Studies

Interference and Transient Effects on Compression Ramp Flows at Hypersonic Mach Numbers A.J.D. Smith and R.A. East	41
Effects of Leading-Edge Bluntness on Control Flap Effectiveness at Hypersonic Speeds D. Kumar and J.L. Stollery	47
Measuring the Effect of Nose Bluntness on Drag of a Cone in a Hypervelocity Shock Tunnel Facility L.M. Porter, A. Paull and D.J. Mee	53
Navier-Stokes Simulation and Measurement of Cone Drag at $M_\infty = 7.9$ C. Jessen, H. Grönig, M. Watanabe and K. Takayama	57
The Boundary Layer on a Sharp Cone in High-Enthalpy Flow P. Germain and H. Hornung	63
Shock Wave Interactions in Hypervelocity Flow S.R. Sanderson and B. Sturtevant	69
Experimental Investigation of Shock-on-Shock Interactions in the High-Enthalpy Shock Tunnel Göttingen (HEG) S. Kortz, T.J. McIntyre and G. Eitelberg	75
Oblique Shock Interactions with Mach Number Distributions D.R. Buttsworth and R.G. Morgan	81
Shock Wave/Boundary Layer Interaction in High-Enthalpy Compression Corner Flow S.G. Mallinson, S.L. Gai and N.R. Mudford	87
Strength of Characteristics at a Curved Shock Wave Sannu Mölder	93
Blunt Body Flow - The Transonic Region Sannu Mölder	101

Shock Tube Application to the Study of Compressible Turbulent Boundary Layer With Mass Injection J.-Y. Liaw and D. Bershader	105
Interaction of Thermal Protection Materials with the High Enthalpy Flow of the Arc-Heated Wind Tunnel LBK A. Gülhan	111
An Attractor-Driven Approximation for Turbulent Burst Dynamics in a Supersonic Free Shear Layer J.A. Johnson III, L.E. Johnson, and J. Zhang	117
Effect of Nozzle Configurations on Unsymmetrical Supersonic Flows Y. Watanabe, S. Matsuo and F. Higashino	123
Radiative Heat Transfer from a Shock Layer Generated Around a Projectile Launched in a Ballistic Range Kimiya Komurasaki, Jiro Kasahara, Shujiro Yano and Toshi Fujiwara	127
Aerodynamic Heating in Three-Dimensional Bow Shock Wave/Turbulent Boundary Layer Interaction Region Syozo Maekawa, Shigeru Aso, Shigehide Nakao, Kazuo Arashi, Kenji Tomioka and Hiroyuki Yamao	133
Parabolic Viscous Shock Layer Theory for 3D Hypersonic Gas Flow S.V. Peigin	139
Viscous Hypersonic Flow over a Body Flying Through a Thermal in the Atmosphere I.F. Muzafarov, V.U. Nabiev, S.V. Utyuzhnikov and N.K. Yamaleev	145

Part 2: Combustion and Ram Accelerators

Hydrogen Mixing and Combustion in a High-Enthalpy Hypersonic Stream R.T. Casey and R.J. Stalker	151
Transverse Jet Mixing and Combustion Experiments in the Hypersonic Shock Tunnel T5 at GALCIT J. Bélanger and H. Hornung	157
Three-Dimensional Mixing Flow Field in Supersonic Flow Induced by Injected Secondary Flow Through a Traverse Circular Nozzle Shigeru Aso, Shozo Maekawa, Michiaki Tan-Nou, Satosh Okuyama, Yasunori Ando and Yoshiyuki Yamane	163
Limitations of the Ram Accelerator M. Brouillette, D.L. Frost, F. Zhang, R.S. Chue, J.H.S. Lee, P. Thibault and C. Yee	171
Stability Studies of Detonation Driven Projectiles F. Zhang, D.L. Frost, R.S. Chue, J.H.S. Lee, P. Thibault and C. Yee	177
Bow Shock Wave Heating and Ablation of a Sharp-Nosed Projectile Flying Inside a Ram Accelerator F. Seiler and K.W. Naumann	183
In-Tube Photography of Ram Accelerator Projectiles C. Knowlen, A.J. Higgins, A.P. Bruckner and A. Hertzberg	189

Part 3: Shock Tube Technology and Diagnostic Techniques

Hypervelocity Aerodynamics in a Superorbital Expansion Tube
A.J. Neely and R.G. Morgan 197

Influence of Secondary Diaphragm on Flow Quality in Expansion Tubes
G.T. Roberts, R.G. Morgan and R.J. Stalker 203

Noise Reduction in Argon Driven Expansion Tubes
A. Paull 209

On the Principle, Design, and Performance of an Expansion-Shock Tube for Nucleation Studies
K.N.H. Looijmans, J.F.H. Willems and M.E.H. van Dongen 215

High-Frequency Generation of High-Pressure Pulses Using a Diaphragmless Shock Tube
Koji Teshima 221

A New Diaphragmless Shock Tube Facility for Interface Instability and Mach Reflection Studies
Yong W. Kim 227

Analysis of Calibration Results in the High-Enthalpy F4 Hot-Shot Wind Tunnel
Ph. Sagnier and G. François 233

The Tailored Nozzle: A Method for Reducing the Convective Heat Transfer to Nozzle Throats by Gasdynamic Shielding
A. Hertzberg, K. Takayama, J. Hinkey and S. Itaka 239

Dealing with Pressure Oscillations in Stalker Tubes
M.-P. Dumitrescu, R. Brun, M. Billiotte, J.M. Bertoni, Y. Burtshell, A. Canova, L.Z. Dumitrescu, L. Houas, L. Labracherie and D. Zeitoun 247

Comparison of the Flow in the High-Enthalpy Shock Tunnel in Göttingen with Numerical Simulations
T.J. McIntyre, J.R. Maus, M.L. Laster and G. Eitelberg 251

A Numerical and Experimental Study of the Free Piston Shock Tunnel
Katsuhiro Itoh, Kouichiro Tani, Hideyuki Tanno, Masahiro Takahashi, Hiroshi Miyajima, Takahisa Asano, Akihiro Sasoh and Kazuyoshi Takayama 257

Use of Argon-Helium Driver-Gas Mixtures in the T4 Shock Tunnel
P.A. Jacobs, R.G. Morgan, R.J. Stalker and D.J. Mee 263

A Velocity Interferometric Study of the Performance of a Gas Gun
T. Matsumura, H. Ohuchi, N. Narayanswami, A. Sasoh and K. Takayama 269

Balances for the Measurement of Multiple Components of Force in Flows of a Millisecond Duration
D.J. Mee, W.J. Daniel, S.L. Tuttle and J.M. Simmons 275

Further Developments of the ISL Millisecond Aerodynamic Force Measurement Technique
K.W. Naumann, H. Ende, G. Mathieu and A. George 281

Six-Component Force Measurement in the Aachen Shock Tunnel
C. Jessen and H. Grönig 287

Driver Gas Detection by Quadrupole Mass Spectrometry in Shock Tunnels J.C. Slade, K.C. Crane and R.J. Stalker	293
Skin Friction Measurements and Reynolds Analogy in a Hypersonic Boundary Layer G.M. Kelly, J.M. Simmons and A. Paull	299
Optical Studies of the Flow Start-up in Convergent-Divergent Nozzles Klaus-Otto Opalka	305
Two Electric Discharge Methods for Visualizing Three-Dimensional Shock Shapes Around Hypersonic Vehicles Masatomi Nishio	311
Dual-Laser PLIF Imaging Techniques for Shock Tube Studies of Mixing and Combustion B.K. McMillin, J.M. Seitzman, J.L. Palmer and R.K. Hanson	315
An Examination of the Aachen Shock Tunnel TH ₂ Gas Flows Using the HEG PLIF Apparatus W.H. Beck, M. Scheer and M. Vetter	321

Part 4: Numerical Computations

Comparison of Numerical Methods 1: DSMC Simulations and N-S Predictions on Bluff Bodies Martin Gilmore	329
Application of Multiblock Codes for Computational Aerothermodynamics of Hyper- sonic Vehicles Pénélope Leyland, Françoise Perrel and Jan B. Vos	335
Numerical Analysis of Shock/Shock and Shock/Body Interactions for 3D Configura- tions G. Hartmann and S. Menne	341
Hypersonic Shock-Wave/Boundary Layer Interactions with an Implicit Navier-Stokes Solver Pénélope Leyland	347
Visualisation of Shock Waves in Hypersonic CFD Solutions H.-G. Pagendarm, B. Seitz and S.I. Choudhry	353
Shock Wave Interactions in Hypersonic Flow S.L.B. Yeung and I.M. Hall	359
Numerical Simulation of Transient Bluff Body Flows J.F. Milthorpe	365
An Efficient Unstructured Euler Solver for Transient Shocked Flows A.A. Fursenko, D.M. Sharov, E.V. Timofeev and P.A. Voinovich	371
CTH: A Software Family for Multi-Dimensional Shock Physics Analysis E.S. Hertel, Jr., R.L. Bell, M.G. Elrick, A.V. Farnsworth, G.I. Kerley, J.M. McGlaun, S.V. Petney, S.A. Silling, P.A. Taylor and L. Yarrington	377

Computation of Viscous Shock/Shock Interactions with an Upwind LU Implicit Scheme D. Darracq and M. Gazaix	383
Numerical Calculations in Support of Complex Shock Interactions Charles E. Needham, Shuichi Hikida and Lynn W. Kennedy	389
Numerical Simulation of Shock Induced Unsteady Aerodynamic Heating with a Highly Dense Mesh System Kenichi Ohyama, Shigeru Aso and Masanori Hayashi	395
A Comparison Study of Two Finite-Element Schemes for Computation of Shock Waves Hong Luo, Joseph D. Baum and Rainald Löhner	401
Adaptive Mesh Refinement Computation of Compressible Flow N. Uchiyama, O. Inoue	407
Shock-Capturing Schemes with Entropy Corrections and Dynamically Adaptive Unstructured Meshes Roland Richter and Pénélope Leyland	413
Computing Complex Shocked Flows Through the Euler Equations A.M. Landsberg, J.P. Boris, T.R. Young and R.J. Scott	421
A Third-Order ENO Scheme on Unstructured Meshes. Application to Shock Wave Calculations Rémi Abgrall	427
Numerical Simulation of Compressible Viscous Flows C. Mügler, B. Meltz, M. Vandenboomgaerde, S. Gauthier, S. Aubert, L. Hallo, P. Ferrand and M. Buffat	433
Time-Dependent Simulation of Reflected-Shock/Boundary Layer Interaction in Shock Tubes G.J. Wilson, S.P. Sharma and W.D. Gillespie	439
Numerical Simulation of Viscous Flow in a Super-Orbital Expansion Tube N. Akman and R.G. Morgan	445
Analysis of the Flow Perturbations in a Shock Tube Due to the Curvature of the Diaphragm V. Daru and J.P. Damion	451
One-Dimensional Simulation of Free-Piston Shock Tunnel/Expansion Tubes M. Mitsuda, T. Oda, T. Kurosaka, S. Wakuri and T. Arai	457

Contents - Volume II

Survey Paper

Volume II: Physico-Chemical Processes and Nonequilibrium Flows - An Introductory Survey John H. Kiefer	3
--	---

Plenary Lectures

The Role of Lasers in Shock Tube Studies of Chemical Kinetics R.K. Hanson	7
Experimental Verification of Real Gas Effects in High Enthalpy Flows G. Eitelberg	15

Part 1: Chemical Kinetics

Vibrational Temperature Measurements in a Shock Layer Using Laser Induced Predis- sociation Fluorescence D.J. Sutton, A.F.P. Houwing, P.C. Palma and R.J. Sandeman	27
Semiconductor Laser Diagnostics of Kinetic and Population Temperatures in High- Enthalpy Flows H. Andrew Chang, Douglas S. Baer and Ronald K. Hanson	33
A Laser Photolysis Shock Tube Study of the Reaction of OH with NH ₃ John D. Mertens, Margaret S. Wooldridge and Ronald K. Hanson	37
Pressure Influence on the Rate of NF ₃ Decomposition Behind Shock Waves N.N. Koudriavtsev, A.M. Sukhov and D.P. Shamshev	43
A Shock Tube Study of the Oxidation of Silicon Atoms by NO and CO ₂ Hans Jürgen Mick and Paul Roth	47
On the Formation of S(³ P) and S(¹ D) During the Thermal Decomposition of COS Behind Shock Waves D. Woiki and P. Roth	53
Experiments on Shock-Heated Ozone Dissociation in Oxygen/Air Using UV Laser Spectroscopy M.L. Thoma and F.J. Hindelang	59
High-Temperature Reactions of Ozone with Bromine Behind Shock Waves. Rate Constant for the Reaction BrO+BrO→2Br+O ₂ Kazuo Takahashi, Junichi Honda, Tadaaki Inomata and Hiroshi Jinno	65
High-Temperature Reaction of O(³ P)+H ₂ S Kentaro Tsuchiya, Hiroyuki Matsui, Masaaki Oya and Gabrielle Dupré	71
Direct Measurement of the Reaction H+CO ₂ at Elevated Temperatures K. Wintergerst and P. Frank	77
A Shock Tube Study of Nitric Acid Decomposition Margaret S. Wooldridge, Ronald K. Hanson and Craig T. Bowman	83

The Reaction of CN with NO at High Temperatures in Shock Waves Y. He, C.H. Wu, M.C. Lin and C.F. Melius	89
A Shock Tube Study of the Reaction $\text{CH} + \text{NO} \rightleftharpoons \text{Products}$ Using a Perturbation Method Michael W. Markus and Paul Roth	95
Kinetics of the Decay of CH_3 Radicals in Shock Waves Joseph Zhichun Su and Heshel Teitelbaum	101
Thermal Reactions of Oxiran, Methyloxiran and Dimethyloxiran. Single-Pulse Shock Tube Investigation Assa Lifshitz	107
Reactions of $\text{C}_3\text{H}_3\text{Cl}$ with H_2 , C_3H_4 , C_2H_2 and C_2H_4 Behind Reflected Shock Waves R.D. Kern, H. Chen, Z. Qin and K. Xie	113
High-Temperature Unimolecular Decomposition of Ethyl Chloroformate: Comparison of the Secondary Competing Steps with Ethyl Formate K. Saito, A. Oda and K. Tokinaga	119
Single-Pulse Shock Tube Studies on the Reactions of Hydrogen Atoms with Acetone and Dimethylether Wing Tsang and J.P. Cui	125
Studies on the Reactions of Atomic Oxygen(3P) with C_2 - C_6 Alkanes at High Temperatures: Examination of the Transition State Theory Akira Miyoshi, Kentaro Tsuchiya, Atsumu Tezaki and Hiroyuki Matsui	131
Nonlinear Effects of Ultrasonic Cavitation in a Catalyst Production Process V.Yu. Borodyllin, N.V. Malykh and V.M. Petrov	137

Part 2: Combustion Kinetics

Combustion and Shock Waves in H_2 - O_2 -Steam Systems A.Yu. Kusharin, O.E. Popov and G.L. Agafonov	143
Comparison Between the Ignition of H_2 -Air- CO_2 and H_2 -Air- H_2O Mixtures by a Hot Gas Jet N. Djebaili, R. Lisbet, C. Paillard and G. Dupré	149
Reduced Chemical Reaction Mechanism of Shock-Initiated Ignition of Methane and Ethane Mixtures with Oxygen W.C. Gardiner, Jr., V.V. Lissianski and V.M. Zamanski	155
Comparison of Shock-Tube Ignition Characteristics of Various Fuel-Air Mixtures at High Pressures K. Fieweger, H. Ciezki and G. Adomeit	161
Investigation on Soot Formation of n-Heptane-Oxygen-Argon Mixtures in a High Pressure Shock Tube J. Yao, K. Fieweger, M. Kleppel and G. Adomeit	167
Shock Tube Study of High-Temperature Oxidation of Phenyl Radical N. Fujii, H. Muratake, K. Okamura, T. Kobayashi and Y. Nosaka	173
Shock Tube Combustion of Liquid Hydrocarbon Sprays at High Temperatures P. Cadman	179
Spray Combustion of Methanol in Reflected Shock Waves T. Tsuboi and R. Katoh	185

Numerical Simulation of Shock Waves Through Combustible Two-Phase Media A. Koichi Hayashi, Takayuki Fuyuto and Toshi Fujiwara	191
Ignition Delay-Times of n-Pentane in a Shock Tube Alexander Burcat and Michael Dvinyaninov	197
A Shock Tube Study of the Reaction $\text{CH}_3 + \text{O}_2$ M. Braun-Unkhoff, C. Naumann and P. Frank	203
Shock-Controlled Chemical Processing A.T. Mattick, D.A. Russell, A. Hertzberg and C. Knowlen	209

Part 3: Non-Equilibrium Flow

Hypervelocity Carbon Dioxide Flow Simulation R.G. Morgan, A.J. Neely and M.L. Scott	217
Experiments on Hypervelocity Dissociating Flow over Spheres Chihyung Wen and Hans Hornung	223
Raman Scattering Measurements of Vibrational Relaxation in Expanding Nitrogen W.D. Gillespie and S.P. Sharma	229
Comparisons of CFD with CARS Measurements in Hypervelocity Nitrogen Flows R.R. Boyce, D.R.N. Pulford, A.F.P. Houwing, Ch. Mundt and R.J. Sandeman	235
Research on Nonequilibrium Phenomena at NASA Ames's E.A.S.T. Facility Surendra P. Sharma	241
Numerical Simulation of Reacting Flows Related to the HEG K. Hannemann, S. Brück and G. Brenner	251
Measurement of Heterogeneous Recombination Probabilities in Shock-Tube Simulation of Space Shuttle-Type Reentry N.N. Koudriavtsev	257
Front Structures of Strong Shock Waves in Air J. Koreeda, H. Yanagisawa, K. Maeno, H. Honma, S.A. Bystrov, V.I. Ivanov and F.V. Shugaev	263
Non-Equilibrium Flow Behind Strong Shock Waves in Air A. Viviani, R. Savino and S. Cozzolino	269
Level Kinetics of the Dissociation and Vibrational Relaxation Behind Shock Waves E. Nagnibeda	275
Vibration-Dissociation Relaxation Phenomena in Shock-Heated Nitrogen J.G. Méolans, M. Mouti, F. Lordet and A. Chauvin	279
Two-Temperature Chemical Kinetics. Dissociation of Diatomic Molecules Behind a Strong Shock Wave Stalii A. Losev and Oleg P. Shatalov	285
Experimental Investigation of Non-Equilibrium Temperatures in a Plane Shock Wave Yury V. Romanenko, Oleg P. Shatalov and Igor E. Zabelinsky	289

Nonequilibrium Flow Around an Injection Jet into a Hypersonic Flow Yumiko Inoue and A. Koichi Hayashi	293
Propagation Behaviour of Strong Shock Waves with Chemical Reactions in a Shock Tunnel Nozzle M. Nishida and M.G. Lee	301
Studies of Nonequilibrium Effects in Nozzle Flow Under High Reservoir Conditions Le Jialing and Dong Weizhong	307
Chemically Reacting Multi-Nozzle Plume Flows T.P. Roberts	313
Nonequilibrium Hypersonic Flow Around a Blunt Body E. Schall and D. Zeitoun	321
A New Model for Rotation-Vibration-Dissociation Coupling in a Multi-Component Viscous Shock Layer Sergey V. Zhluktov and Gennadiy D. Smekhov	327
Viscous Shock Layer Analysis Using a Three-Temperature Model Y. Sakamura and M. Nishida	333
Huygens Probe Radiative Environment Marc Baillion, Gilles Taquin and Jacques Soler	339
DSMC Computation of Radiative Heat Flux During Huygens Entry into the Titan Atmosphere Torkil S. Mogstad	347
Radiation from Air Shock Layers with Chemical and Ionizing Reactions M.A. Gallis and J.K. Harvey	355
Weak Shock Waves Passing over a Hemicylinder in Carbon Dioxide H. Honma, K. Maeno, M. Itabashi and N. Watanabe	361

Part 4: Plasmas, Astrophysics

Exact Hydrodynamic Equations and Transport Coefficients in Higher-Order Approximations for Partially-Ionized Gases G.A. Tirskiy	369
Reaction Kinetics Accounting for Carbon Impurities in Krypton Shock Waves Dieter Klages and Frank Demmig	375
Electron Driven Shock Waves: Antiforce Class II Waves Mostafa Hemmati	381
Modelling of Shock Wave Propagation in a Developing Discharge in Nitrogen N.Yu. Babaeva, A.Kh. Mnatsakanyan and G.V. Naidis	387
Shock Wave Structure in a High-Frequency Discharge Plasma S.A. Bystrov, E.N. Fomenko, F.V. Shugaev and G.I. Shved	391
Shock Waves and Flows in UV Laser-Produced Plasmas Th. Sarnet, J.E. Montagne, G. Inglesakis and M. Autric	395

Influence of Shock Waves on the Beam Quality of a High Pulse Repetition Frequency XeCl Laser O.P. Uteza, M.L. Sentis, Ph.C. Delaporte, B.M. Forestier and B.L. Fontaine	401
Shock Wave Study in a VUV Formed-Ferrite Plasma Source M.L. Sentis, F. Chazaud, L.H. Chinh, Ph. Delaporte and S. Moulines	407
Numerical Modelling of the Internal Ballistics of Electrothermal-Chemical Guns Edward Figura	413
Experimental Study of a Supersonic Low Pressure Nitrogen Plasma Jet B.G. Cheron, L. Robin and P. Vervisch	419
Shock Tube Conjugated with Nanosecond Discharge Gap for Investigating Shock Wave Propagation in Plasma A.A. Alyapin, I.V. Filiougine, S.V. Kostiouchenko and N.N. Koudriavtsev	425
Intensive Beam Source of Fast Neutral Atoms Generated by an Electromagnetic Shock Tube N.N. Koudriavtsev, O.A. Maziar and A.M. Sukhov	429
Interaction of Strong Discontinuities in Magnetized Conducting Media A.A. Barmin and E.A. Pushkar'	433
Oblique Interaction of Strong Solar Wind Discontinuities in the Vicinity of the Terrestrial Magnetosphere E.A. Pushkar' and S.A. Grib	439

Survey Paper

Volume III: Shock Waves in Condensed Matter and Heterogeneous Media – An Introductory Survey M.E.H. van Dongen	3
--	---

Plenary Lectures

Shock Wave Impact on Porous Materials B.W. Skews	11
Cellular and Tissular Effects of Shock Wave-Induced Cavitation: Potential Application to Digestive Cancers F. Prat and A. Arefiev	21

Part 1: Two-Phase Flows

Entrainment of a Spherical Particle by the Flow Behind a Shock Wave M. Olim, H. Nagoya, K. Takayama and F. Hiatt	31
On the Importance of the Basset History Term on the Particle Motion Induced by a Plane Shock Wave M. Sommerfeld and S. Decker	37
Drag Coefficient Measurement of Spheres in a Vertical Shock Tube and Numerical Simulation G. Rodriguez, P. Grandeboeuf, M. Khelifi and J.-F. Haas	43
Experimental and Numerical Investigation of Shock Wave Attenuation in Dust-Gas Suspensions O. Igra, G. Ben-Dor, F. Aizik and B. Gelfand	49
Numerical Simulation of Shock Wave Reflection and Diffraction in a Dusty Gas Shmuel Eidelman, Xiaolong Yang and Itzhak Lottati	55
Numerical Simulation of Dusty Shock Diffraction Around a 90 Degree Corner B.Y. Wang, Q.S. Wu, H. Zhu and Y.H. Xu	61
Numerical Simulation of the Interaction of a Shock Wave with a Two-Phase Interface Q. Yu, A. van de Ven, J.H. Geng, F. Zhang and H. Grönig	67
Turbulent Boundary Layer Over a Dust Bed K.-Y. Chien, R.E. Ferguson, J.P. Collins, A.L. Kuhl and R.G. Batt	73
Optical Observation of Mach Reflection of a Partly Dispersed Shock Wave by Sub- Micron Water Droplets in Air H. Hirahara and M. Kawahashi	77
Effects of the Injection of Droplets on a Stationary Shock Wave in a Nozzle F. Utheza, R. Saurel, E. Daniel and J.C. Loraud	83
Impact of Strong Shock Waves on Monodisperse Isopropanol Droplet Streams N. Widdecke, W. Klenk and A. Frohn	89

Droplet Behaviour in Underexpanded Supersonic Jets M. Sommerfeld and J. Kurian	95
Shock Tube Study of Droplet-Vapor Phase Transition of Hexane in Argon F. Peters and B. Paikert	101
Thickness Measurements of Partial Liquefaction Shock Waves M. Herrmann and F. Obermeier	107
Interferometric Measurements and Numerical Simulation of Relaxation in an Argon-Steam Mixture F. Maršík, J. Blaha and P. Sopuch	113
Propagation of Shock Waves Through a Gas Mixture Due to Strong Evaporation from a Plane Condensed Phase Y. Onishi and H. Miura	119
Measurements on Film Condensation Behind Incident and Reflected Shock Waves T. Teske and F. Obermeier	125
On the Onset of Condensation in Rarefaction Waves in Shock Tubes Can F. Delale and Günter H. Schnerr	131
Influence of Shock Waves on the Condensation Process in a Nozzle A.L. Itkin, A.V. Rodionov and E.G. Kolesnichenko	135
Propagation of Shock Waves in Dilute Bubbly Liquids M. Kameda, Y. Matsumoto and Y. Haneda	141
“Resonance Solitons” in a Bubbly Liquid N.V. Malykh	147
Analytical Techniques for the Problem of the Interaction of Nonlinear Sonic Waves with Nonuniform Media A.A. Lugovtsov	151
An Adaptive Gridding Approach to the Computation of Reactive Two-Phase Flows in Two Dimensions W. Speares and E.F. Toro	155

Part 2: Shocks in Porous Media

On the Modelling of Wave Phenomena in Permeable Foam M.E.H. van Dongen, D.M.J. Smeulders, T. Kitamura and K. Takayama	163
A Multiphase Model for Shock-Induced Flow in Low-Density Foam M.R. Baer	169
Structure of Deformation Waves in Porous Compressible Materials Under the Influence of Shock Waves L.G. Gvozdeva, Yu.M. Faresov and Yu.L. Sharov	175
Transmission of a Blast Wave Through a Deformable Layer J.J. Lee, D.L. Frost and J.H.S. Lee	181
Peculiarities of Weak Shock Wave Propagation in a Gas-Liquid Foam I.I. Goldfarb, V.P. Melnikov, Z.M. Orenbakh, I.R. Shreiber and F.I. Vafina	187

Pressure Waves in Gas-Liquid Foams
 T. Elperin, O. Igra and Z. Orenbakh 193

Formation of Shock Waves in Gas-Liquid Foams
 T. Elperin, O. Igra and I. Shreiber 197

Jump Conditions Across Strong Compaction Waves in Gas-Saturated Rigid Porous Media
 A. Levy, G. Ben-Dor, S. Sorek and J. Bear 203

Head-on Collision of a Normal Shock Wave with a Polyurethane Foam
 E. Zaretsky and O. Igra 209

Head-on Collision of Shock Waves with Porous Materials: Experimental and Numerical Investigation
 G. Ben-Dor, O. Igra, G. Mazor, H. Onodera and K. Takayama 215

Head-on Collision of Normal Shock Waves with Rigid Porous Materials
 A. Levy, B.W. Skews, G. Ben-Dor and S. Sorek 221

Slow Detonation in Filtration Combustion
 Vladimir Gol'dshtein, Isaak Shreiber and Gregory Sivashinsky 227

Part 3: Shocks in Condensed Matter

Liquid Fracture at Explosive Loading
 V. Kedrinskii 233

Characterization of Pressure Waves in Liquids Using an Interferometric Method
 A.P. Alloncle, D. Dufresne and M. Autric 239

Laser-Generated Shock Waves
 D.C. Emmony, M.K.B. Suaidi and B. Ward 245

Laser Generation of Stress Waves in Metal
 Jean-Eric Masse and Gérard Barreau 251

High-Power Laser Radiation-Induced Shock Waves in Solids
 Ch. Prat and M. Autric 255

Beam-Matter Experiments with High-Power Proton Beams on KALIF
 K. Baumung, H.J. Bluhm, P. Hoppé, H.U. Karow, D. Rusch, G.I. Kanel, V. Licht, S.V. Razorenov and A.V. Utkin 261

A Numerical Study of Explosive-Driven Cylindrical Imploding Shocks in Solids
 T. Hiroe, H. Matsuo and K. Fujiwara 267

Model of Viscoelastic Unidirectional Composite with Coupled Thermal and Elastic Processes
 A.D. Resnyansky and E.I. Romensky 273

Underwater-Shock Consolidation of TiAl Powder
 A. Chiba, M. Nishida, R. Tomoshige, K. Imamura and C. Moon 279

An Adaptive Mesh Method to Speed up the Numerical Simulation of an Underwater Explosion
 Philippe Boyce and Thierry Hocquetlet 285

Converging Underwater Shock Waves for Metal Processing S. Itoh, M. Fujita, S. Nagano and K. Kamohara	289
Hugoniot Adiabate of Plasticized TATB-Based Explosive Compositions E.V. Shorohov and B.V. Litvinov	295
Substance Compression Under Strong Shock Waves with Allowance for Nuclei Dissociation B.V. Litvinov, N.P. Purygin, S.V. Samylov and I.V. Sanin	299
Equations of State and Matter Transformation Parameters Under Shock Compression for Epoxy Resin K.K. Krupnikov and V.P. Krupnikova	301
Quasi-Spherical Pulsed Loading Impact on Solid Metal Balls N.P. Purygin and V.I. Buzanov	307
X-Ray Line Broadening Analysis of Dynamic Loaded Aluminium Metal Matrix Composite C. Patuelli	311
Application of Parallel Processors to Shock Wave Modelling S.B. Bazarov, A.V. Shutov, O.Yu. Vorobiev, A.V. Zharov, V.E. Fortov and B.P. Krukov	317

Part 4: Industrial Applications and Environment

Laser-Supported Absorption Waves in Radiation-Metal Interaction C. Dumas, M. Ghrab, C. Prat and M. Autric	323
Shock Waves in the Cavity of a Xe-He Excimer Laser S. Kosugi, T. Ohishi, K. Maeno and H. Honma	329
Aerothermodynamic and Thermal Phenomena in a High Pulse-Repetition Rate XeCl Laser J.P. Truong, O. Uteza, M.L. Sentis, P. Delaporte, B. Forestier and B. Fontaine	335
Power Reduction of Excimer Lasers Caused by Electromagnetic Shock Waves Due to Repetitively Pulsed Discharge E. Hirai, N. Nagai and H. Yamakoshi	341
Attenuation and Distorsion of Propagating Compression Waves in a High-Speed Railway Model and in Real Tunnels Toshiyuki Aoki, Kazuyasu Matsuo, Hideto Hidaka, Yasuhiro Noguchi and Syunji Morihara	347
A Numerical and Experimental Study of Sonic Booms Generated in High-Speed Train Tunnels A. Sasoh, T. Saito, S. Funabashi, O. Onodera, K. Takayama, Y. Matsui and R. Kaneko	353
Effects of Shock Waves on Silencer Characteristics in the Exhaust Gas Flow of Automobile Engines Noriaki Sekine, Ichiro Kudo, Osamu Onodera and Kazuyoshi Takayama	359
Noise Induced by Weak Shock Waves in Automobile Exhaust Systems (Effects of Viscosity and Back Pressure) S. Matsumura, O. Onodera and K. Takayama	367
An Experimental Study of an Intelligent Muzzle Brake K.C. Phan	373

Effects of Shock Waves on Jet Mixing and Noise Generation
 K. Kailasanath, J.P. Boris and A.M. Landsberg 379

Numerical Simulations of Blast Wave Propagation Induced by Eruptions of Volcanoes
 T. Saito, T. Kitamura, K. Takayama, N. Fujii and H. Taniguchi 385

Experiments and Analysis of Orbital Debris Shock-Induced Penetration of Pressure
 Vessels in Space
 Robert M. Schmidt, Kevin R. Housen and Harlow G. Ahlstrom 391

Shocked Quartz, Silica and Carbon Materials in Meteorites and Impact Craters
 Y. Miura, K. Takayama, T. Kato, N. Kawashima, M. Imai, G. Iancu and M. Okamoto 399

Shock Metamorphic Evolution of Meteorites and Impact Craters
 Y. Miura, K. Takayama, N. Kawashima and T. Kato 405

Interaction of Shock Waves with Tree Crowns and the Front of Crown Forest Fires
 A.M. Grishin 411

Shock Tube Pyrolysis Research of Chinese Coals
 Xi-Yu Chang, Ding-An Liu, Miu-Zhi Li and Hui Li 417

Part 5: Biological Aspects

Extra-Auditory Effects of Single and Multiple Blasts
 P. Vassout, G. Parmentier, G. Evrard and A. Dancer 425

Effects of Shock Waves on Living Tissues Using Shock Tubes for Bio-Tests
 M. Tamagawa and T. Akamatsu 429

Extracorporeal Shock Wave Gallstone Lithotripsy
 Hideo Ise, Osamu Kitayama, Seiki Matsuno, Kazuyoshi Takayama and Toshiyuki Okawa 435

Underwater Shock Wave Propagation and Focusing in Inhomogeneous Media
 H. Nagoya, T. Obara and K. Takayama 439

Nonlinear Transmission of Focused Shock Waves in Nondegassed Water
 Č. Štuka, P. Šunka and J. Benes 445

Soft Flash X-ray System for Shock Wave Research
 E. Sato, K. Takahashi, M. Sagae, A. Shikoda, T. Oizumi, H. Ojima, K. Takayama,
 K. Sasaki, Y. Tamakawa and T. Yanagisawa 449

New Discharge Circuit for Efficient Shock Wave Generation
 P.Šunka, V. Babický, M. Člupek and Č. Štuka 455

New Methods of Superpowerful Focused Shock Wave Generation for Medicine and
 Mineralogy
 V. Veroman and O. Novikov 459

Author Index 463

Contents - Volumes I, II, IV 471

Shock Waves

An International Journal

Editor-in-Chief: I.I. Glass, Downsview, Canada

Managing Editors: R.A. Graham, Albuquerque, USA;
H. Grönig, Aachen, Germany;
A.L. Kuhl, Livermores, USA;
K. Takayama, Sendai, Japan

This journal is aimed at publishing theoretical and experimental results on shock-wave phenomena gases, liquids, solids, and two-phase media from both the fundamental research and the applications points of view. It collates strictly refereed reviews, contributed papers, and short notes in the field, at present spread over numerous publications, in one focused journal.
