which leads to the conclusion that

$$\oint\limits_K (M\,dx\,+\,N\,dy)\,=\,2\pi$$

for any such curve K. We can explain this result by changing to polar coordinates. With

$$x = r\cos\theta,$$
 $y = r\sin\theta,$ $dx = -r\sin\theta, d\theta + \cos\theta,$

 $dx = -r\sin\theta \,d\theta + \cos\theta \,dr,$

$$dy = r\cos\theta \, d\theta + \sin\theta \, dr,$$

we have

$$\frac{x\,dy-y\,dx}{x^2+y^2}=\frac{r^2(\cos^2\theta+\sin^2\theta)\,d\theta}{r^2}=d\theta,$$

and θ increases by 2π as we traverse K once counterclockwise.

Verifying Green's Theorem

In Exercises 1-4, verify the conclusion of Green's Theorem by evaluating both sides of Equations (3) and (4) for the field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$. Take the domains of integration in each case to be the disk R: $x^2 + y^2 \le$ a^2 and its bounding circle C: $\mathbf{r} = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j}$, $0 \le t \le 2\pi$.

Calculating Area with Green's Theorem

If a simple closed curve C in the plane and the region R it encloses satisfy the hypotheses of Green's Theorem, the area of R is given by

Green's Theorem Area Formula

Area of
$$R = \frac{1}{2} \oint_C x \, dy - y \, dx$$
 (13)

The reason is that by Equation (3), run backward,

Area of
$$R = \iint_R dy \, dx = \iint_R \left(\frac{1}{2} + \frac{1}{2}\right) dy \, dx$$
$$= \oint_C \frac{1}{2} x \, dy - \frac{1}{2} y \, dx.$$

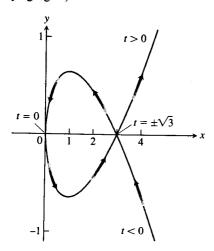

Use the Green's Theorem area formula (Equation 13) to find the areas of the regions enclosed by the curves in Exercises 21-24.

, $-\sqrt{3} \le t \le \sqrt{3}$ (see accompanying figure).
